Liver Transplantation: Update of Concepts and Practice, An Issue of Clinics in Liver Disease. Kalyan Ram Bhamidimarri 2014-09-08 A number of areas within liver transplant continue to evolve as the field matures. The advent of increasingly effective therapy for HCV will dramatically reduce the burden of recurrent disease within the next few years. HCC has become a well established indication for transplant with an increasing emphasis on adjuvant therapies to reduce the risk of tumor recurrence and potentially expand the acceptable limits of tumor burden amenable to liver transplant. Renal dysfunction is a frequent complication of decompensated liver disease and an important predictor of diminished post-transplant survival. Newer approaches to therapy including terlipressin will reduce the impact of renal dysfunction in liver transplant candidates and potentially reduce the need for combined liver/kidney transplant. Increasing attention is being paid to role of comorbidities such as diabetes and hypertension on longterm recipient outcomes. Retransplantation remains a challenge with a variety of models available to predict outcomes. Cardiac disease pretransplant is an area of active investigation with newer entities such as cirrhotic cardiomyopathy a growing concern. These are some of many evolving issues in liver transplant which will be addressed to update our readers and which in turn will enhance the care of patients with liver disease.

*Clinical Pancreatology for Practising Gastroenterologists and Surgeons* Juan Enrique Dominguez-Munoz 2021-05-24 Clinical Pancreatology Since the book *Clinical Pancreatology for Practising Gastroenterologists and Surgeons* was first published sixteen years ago, the knowledge and clinical management of pancreatic diseases have developed markedly. Thanks to the development of the translational research and the from bench to bedside concept, much progress from the lab has been applied to clinical practice. In addition, several highly relevant clinical trials published over the last years have resulted in the update and optimisation of clinical guidelines. A new and validated classification of severity and complications of acute pancreatitis is firmly rooted in clinical practice and has been the basis for the development of minimally invasive approaches to pancreatic necrosis. The etiopathogenic knowledge of chronic pancreatitis and other pancreatopathies, like that associated with diabetes mellitus, has developed significantly. Especially important has been the development of the field of cystic pancreatic tumours, which has been reflected in the publication of several guidelines and consensus reports over the last few years. Most research efforts have focused on pancreatic cancer, which have led and will further lead to a significant increase in the therapeutic armamentarium against this devastating disease. Finally, many newly published studies have changed the concept, causes, clinical relevance, diagnosis and treatment of exocrine pancreatic insufficiency. This new edition of *Clinical Pancreatology for Practising Gastroenterologists and Surgeons* has enjoyed the collaboration of the world's leading experts in each of the areas of clinical pancreatology with the aim of facilitating gastroenterologists, surgeons, oncologists, internists, nutritionists, diabetologists, paediatricians, radiologists, pathologists and other specialists in their decision making when facing patients with pancreatic diseases in their daily clinical practice. All in all, this book supplies an indispensable update of the relevant aspects of clinical pancreatology.

Authoritative and practical, this important new book not only spells out the advantages and limitations of the latest diagnostic tests, but also provides numerous algorithms for evaluating patients and treating the liver problems commonly encountered by primary care physicians. Here, too, the reader will find described the nuances of serological tests for the detection of viral infections and how best to use invasive and noninvasive radiological tests in specific circumstances. Common complications are fully discussed and detailed practical information is given on how to recognize the patient's immediate problems and deal with them effectively. This book's numerous diagrams, clinical "pearls", and cost comparisons will clarify the often complex and bewildering array of conditions associated with liver disease and make it a definitive and indispensable guide for primary care physicians, medical students, and residents.

**Liver Transplantation, An Issue of Clinics in Liver Disease, E-Book** Roberto J. Firpi 2017-04-12 Cirrhosis from hepatitis C (HCV) is now the most common indication for liver transplant (LT) in the U.S., but between 2004 and 2013, new LT listings for NASH increased by 170%. Unfortunately, fibrosis progression leading to cirrhosis, liver cancer, and liver decompensation continues to occur after transplantation. Once cirrhosis and decompensation

are evident, patient survival is poor and repeat LT is considered to improve outcomes. Therefore, the never-ending thirst for new approaches in the management of patients pre- and post-transplant has led to a very promising future in transplantation, though there is much to learn to achieve better patient outcomes. This issue of Clinics in Liver Disease addresses the core areas to achieve better patient outcomes, with articles devoted to coagulopathy before liver transplant, challenges in renal failure before LT, LT for acute alcoholic hepatitis, LT in the pregnant patient, bariatric surgery and LT, and MELD Scores in prioritization of LT, to name a few. Readers will place a high value on the current state of liver transplantation in this issue.

*Endoscopy in Inflammatory Bowel Disease, An Issue of Gastrointestinal Endoscopy Clinics of North America*, Maria T. Abreu 2016-09-16 The field of inflammatory bowel disease has evolved in many ways. The first has been the revolution in medical therapy for the disease. With the advent of biologic therapy, the aspirational goal of therapy has become mucosal healing. These medications have also made it possible to avoid or delay surgery for ulcerative colitis and Crohn's disease. Although non-invasive strategies such as MR or CT enterography or stool-based assays are helpful, they have not been able to replace the prognostic information provided by endoscopy. Simultaneously, the quality and spectrum of tools available to perform endoscopy has widened. High resolution endoscopes are now the norm and are nearly as good as chromoendoscopy for identifying dysplasia in ulcerative colitis patients. Most gastroenterologists also perform dilations but do not generally do this for patients with IBD. Finally, newer devices such as enteroscopes, endoscopic ultrasound, and endomicroscopes are being incorporated into the algorithms to diagnose and treat complications of IBD. This issue highlights all of these advances by the experts in their fields.
