Formulation as a Basis for Planning Psychotherapy Treatment, Second Edition Mardi J. Horowitz, M.D. 2018-11-12 Formulation as a Basis for Planning Psychotherapy Treatment utilizes a step-by-step structure and copious case illustrations to teach psychiatrists, residents in psychiatry and psychology, social workers, and marriage and family counselors how to plan treatment after the initial diagnosis. This new edition arrives two decades after the first, with revised content, updated case studies, and new insights gleaned over the author's noteworthy career. Clinical formulation, also known as case formulation and problem formulation, is a theoretically-based explanation or conceptualization of the information obtained from a clinical assessment. Although formulation systems vary by different schools of psychotherapy, the author has adopted and here explores a systematic approach based on an integrative effort. This system of configurational analysis combines concepts derived from psychodynamic, interpersonal, cognitive-behavioral, and family system approaches. After an overview of psychological change processes, each of the five steps of configurational analysis is covered systematically: - Step one involves selecting and describing the patient's currently most important symptoms, signs, problems, and topics of concern. For example, symptoms may consist of trouble sleeping or feelings of depression; signs may include discordant verbal and physical expression; problems may include reluctance to go to work or care for family members; and topics of concern might be unresolved grief the patient feels helpless to process without assistance. Since both patient and therapist want to know if these observable phenomena are changing, this list is modified as treatment progresses.- Step two entails describing states in which the patterns of phenomena do and do not occur, with attention to patterns of shifts in states, especially maladaptive state cycles. The therapist is taught how to aggregate and organize this information by describing states of mind--for example, undermodulated (e.g., unthinking rage) or overmodulated (e.g., numbness and lack of affect).- Step three involves describing the challenging topics that patients may both approach and avoid because they are conflicted or unresolved, as well as the obstacles patients may create to divert attention from those topics. For example, patients may avoid a topic or shift attention from it by changing the subject and so forth.- Step four entails describing the organizing roles, beliefs, and scripts of expression and action that seem to organize repetitions in each state, with an effort made to identify dysfunctional attitudes and how these may have evolved from past attachments and traumas. - Finally, step five involves figuring out how to stabilize working states by enhancing the therapeutic alliance and helping the patient contain and master emotional attitudes. At this point, the clinician plans how to counteract avoidances by direction of attention and promotes adaptive social cognitive capacities. From surface observation to deeper inferences, Formulation as a Basis for Planning Psychotherapy Treatment transcends DSM diagnoses, helping clinicians to use information gleaned in the immediacy of the moment to make sound, sensitive, and effective psychotherapeutic decisions.

In the Aftermath of the Pandemic John C. Markowitz 2021-02-01 In the Aftermath of the Pandemic is an accessible treatment manual enabling psychotherapists to use Interpersonal Psychotherapy (IPT) to address the psychological consequences of the COVID-19 pandemic and other large-scale disasters. Well-studied and time-limited, IPT has demonstrated efficacy in treating mood disorders, anxiety disorders, and posttraumatic stress disorder (PTSD). IPT helps people to mobilize social support, to process and take control of environmental stressors, relieving symptoms. As such it appears an excellent intervention for the wave of psychiatric problems accompanying the COVID-19 pandemic. The book describes IPT techniques and focuses on treating the disaster's major outcomes—depression, PTSD, and anxiety—illustrating their treatment with multiple detailed case examples drawn from actual clinical presentations from the pandemic. The book also addresses the sudden shift from in-person to remote tele-therapy, and includes a novel COVID Behavioral Checklist of psychological risk factors. Dr. John Markowitz, a leading IPT expert, explains the psychological impacts of disasters like COVID-19 and the particular usefulness of IPT in addressing them, making this a crucial text for clinicians looking to address the psychiatric crisis the pandemic has wrought.

Approach to the Psychiatric Patient John W. Barnhill 2018-11-21 A fascinating text that addresses the clinical and educational challenges of treating psychiatric patients from a truly multidisciplinary perspective using a case-based format, Approach to the Psychiatric Patient: Case-Based Essays is the only book of its kind and an indispensable addition to the mental health practitioner's library. The new edition builds upon the strengths that distinguished the first, with composite cases that are carefully constructed to capture real-world problems, followed by essays that provide clear and cogent perspectives on the case. These essays cover a wide range, from the more conventional (such as differential diagnosis of anxiety or the clinical characteristics of delirium) to the unusual and intriguing (such as creativity and mental illness or an analysis of the case in relation to the classic, *Strange Case of Dr. Jekyll and Mr. Hyde*). Every chapter has been revised, and the book boasts many new co-contributors, as well as the addition of completely new essays. For example, in the chapter on geriatric depression, several new essays have been added on the topics of collaborative care and the embedded psychiatrist, depression and medical illness, and biomarkers to identify depression subtypes, while the chapter on terminal illness features new essays on spirituality and meaning-centered therapy. In addition, there are new essays on co-occurring anxiety and alcohol use disorders, medication-assisted treatment for stimulant use, treatment of body dysmorphic disorder, and more. The text possesses many useful attributes for the reader: The more than 100 essays were written by a broad range of specialists, each with particular expertise in their aspect of the case, and the resulting commentary is focused and concise. In addition to the case and discussions, each chapter offers an overview and summary points designed to facilitate further consideration of the patient and clinical situation and to focus on the key points. The book's unique structure enhances its flexibility, allowing the reader to read a case and accompanying essays straight through, or to pick and choose as the need or whim arises. The cases' clinical settings are diverse, ranging from inpatient hospitalizations and emergency room evaluations to outpatient assessments and long-term psychotherapies, maximizing relevance and resonance. Each essay has its own bibliography, which provides both rigorous documentation and additional sources for more exploration of the topic. Approach to the Psychiatric Patient: Case-Based Essays distinguishes itself from prior texts in both the richness of its cases and the ingenuity of its format, and its multidisciplinary wisdom and insight will be appreciated by a wide range of readers.

CBT Case Formulation as Therapeutic Process Giovanni Maria Ruggiero 2021-04-09 This book reasserts the importance of case formulation as the first step in implementing effective cognitive behavioral therapies (CBT), centering it as the main operative tool of CBT approaches by which the therapist handles the whole psychotherapeutic process. Chapters discuss specific CBT interventions and components of the treatment, as specific factors including therapeutic alliance and relationship, and theoretical and historical background of CBT practices. In addition, the book assumes that in CBTs the case formulation is a procedure which is continuously shared and reevaluated between patient and therapist throughout the course of treatment. This aspect is increasingly becoming the distinguishing feature of CBT approaches as it embodies CBT's basic tenets and implies full confidence in patients' conscious agreement, transparent cooperation and explicit commitment with CBT's model of clinical change.
