Walk 2013-03-08 This volume on intersensory perception and sensory integration is the second volume of the series, Perception and Perceptual Development: A Critical Review Series. The topic of the volume is timely, for in recent years, many investigators have noted that information about any natural event is obtained by a perceiver from a variety of sources. Such an observation immediately leads to the question of how this information is synthesized and organized. Of course, the implication that there are several discrete input channels that must be processed has come under immediate attack by researchers such as the Gibsons. They find it extremely artificial to regard natural information as being cut up and requiring cementing. Nevertheless, the possibility that during ontogenesis, perception involves the integration of separate information has attracted the attention of scholars concerned with both normal and abnormal development. In the case of normal development, a lively controversy has arisen between those who believe perceptual development goes from integration toward differentiation and those who hold the opposite view. In the case of abnormal psychological development such as learning disabilities, many workers have suggested that perceptual integration is at fault. In thinking about the issues raised in this volume, we are particularly indebted to our former teachers and colleagues: Eleanor and James Gibson, T. A. Ryan, Robert B. MacLeod, and Jerome Bruner. We are pleased to acknowledge the secretarial help of Karen Weeks in the preparation of this volume.

Neuro-Systemic Applications in Learning Kennedy Andrew Thomas 2021-09-01 Neuroscience research deals with the physiology, biochemistry, anatomy and molecular biology of neurons and neural circuits and especially their association with behavior and learning. Of late, neuroscience research is playing a pivotal role in industry, science writing, government program management, science advocacy, and education. In the process of learning as experiencing knowledge, the human brain plays a vital role as the central governing system to map the images of learning in the human brain which may be called educational neuroscience. It provides means to develop a common language and bridge the gulf between educators, psychologists and neuroscientists. The emerging field of educational neuroscience presents opportunities as well as challenges for education, especially when it comes to assess the learning disorders and learning intentions of the students. The most effective learning involves recruiting multiple regions of the brain for the learning task. These regions are associated with such functions as memory, the various senses, volitional control, and higher levels of cognitive functioning. By considering biological factors, research has advanced the understanding of specific learning difficulties, such as dyslexia and dyscalculia. Likewise, neuroscience is uncovering why certain types of learning are more rewarding than others. Of late, a lot of research has gone in the field of neural networks and deep learning. It is worthwhile to consider these research areas in investigating the interplay between the human brain and human formal/natural learning. This book is intended to bring together the recent advances in neuroscience research and their influence on the

evolving learning systems with special emphasis on the evolution of a learner-centric framework in outcome based education by taking into cognizance the learning abilities and intentions of the learners.

Social and Interpersonal Dynamics in Pain Tine Vervooort 2018-07-18 This groundbreaking analysis moves our knowledge of pain and its effects from the biomedical model to one accounting for its complex psychosocial dimensions. Starting with its facial and physical display, pain is shown in its manifold social contexts—in the lifespan, in a family unit, expressed by a member of a gender and/or race—and as observed by others. These observations by caregivers and family are shown as vital to the social dynamic of pain—as observers react to sufferers' pain, and as these reactions affect those suffering. The book's findings should enhance practitioners' understanding of pain to develop more effective individualized treatments for clients' pain experience, and inspire researchers as well. Among the topics covered: Why do we care? Evolutionary mechanisms in the social dimension of pain. When, how, and why do we express pain? On the overlap between physical and social pain. Facing others in pain: why context matters. Caregiving impact upon sufferers' cognitive functioning. Targeting individual and interpersonal processes in therapeutic interventions for chronic pain. Social and Interpersonal Dynamics in Pain will be a valuable resource for clinicians who deal in pain practice and management, as well as for students and researchers interested in the social, interpersonal, and emotional variables that contribute to pain, the processes with which pain is associated, and the psychology of pain in general.

The Out-of-Sync Child Carol Stock Kranowitz 2006-04-04 The groundbreaking book that explains Sensory Processing Disorder (SPD)—and presents a drug-free approach that offers hope for parents—now revised and updated. Does your child exhibit... Over-responsivity—or under-responsivity—to touch or movement? A child with SPD may be a "sensory avoider," withdrawing from touch, refusing to wear certain clothing, avoiding active games—or he may be a "sensory disregarder," needing a jump start to get moving. Over-responsivity—or under-responsivity—to sounds, sights taste, or smell? She may cover her ears or eyes, be a picky eater, or seem oblivious to sensory cues. Cravings for sensation? The "sensory craver" never gets enough of certain sensations, e.g., messy play, spicy food, noisy action, and perpetual movement. Poor sensory discrimination? She may not sense the difference between objects or experiences—unaware of what she's holding unless she looks, and unable to sense when she's falling or how to catch herself. Unusually high or low activity level? The child may be constantly on the go—wearing out everyone around him—or move slowly and tire easily, showing little interest in the world. Problems with posture or motor coordination? He may slouch, move awkwardly, seem careless or accident-prone. These are often the first clues to Sensory Processing Disorder—a common but frequently misdiagnosed problem in which the central nervous system misinterprets messages from the senses. The Out-of-Sync Child offers comprehensive, clear information for parents and professionals—and a drug-free treatment approach for children. This revised edition includes new sections on vision and hearing, picky eaters, and disorders such as autism, among other topics.
