**Bovine Tuberculosis – International Perspectives on Epidemiology and Management** Andrew W. Byrne 2019-10-17 Bovine tuberculosis (bTB) is a significant zoonotic pathogen with a global distribution, and a considerable economic impact. It has a notoriously complex epidemiology, varying by affected region and often involving multiple-host species. Here we present an international collection of papers that address both national and international factors impacting on the control of bovine tuberculosis. We hope this Research Topic will provide a forum which may generate a greater understanding of the disease in a wider context, and inform future eradication efforts through the design of more effective interventions.

**Achieving Sustainable Global Capacity for Surveillance and Response to Emerging Diseases of Zoonotic Origin** National Research Council 2009-01-22 One of the biggest threats today is the uncertainty surrounding the emergence of a novel pathogen or the re-emergence of a known infectious disease that might result in disease outbreaks with great losses of human life and immense global economic consequences. Over the past six decades, most of the emerging infectious disease events in humans have been caused by zoonotic pathogens—those infectious agents that are transmitted from animals to humans. In June 2008, the Institute of Medicine's and National Research Council's Committee on Achieving Sustainable Global Capacity for Surveillance and Response to Emerging Diseases of Zoonotic Origin convened a workshop. This workshop addressed the reasons for the transmission of zoonotic disease and explored the current global capacity for zoonotic disease surveillance.

**Handbook of Zoonoses, Second Edition, Section A** George W. Beran 2019-09-16 This multivolume handbook presents the most authoritative and comprehensive reference work on major zoonoses of the world. The Handbook of Zoonoses covers most diseases communicable to humans, as well as those diseases common to both animals and humans. It identifies animal diseases that are host specific and reviews the effects of various human diseases on animals. Discussions address diseases that remain important public and animal health problems and the techniques that can control and prevent them. The chapters are written by internationally recognized scientists in their respective areas of disease, who work or have worked extensively in the most affected areas of the world. The emphasis for each zoonosis is on the epidemiology of the disease, the clinical syndromes and carrier states in infected animals and humans, and the most current methods for diagnosis and approaches to control. For infectious agents or biologic toxins, which may be transmitted by foods of animal origin, a strong focus is placed on food safety measures. The etiologic and therapeutic aspects of each disease important to epidemiology and control are identified.

**Veterinary Epidemiology** Michael Thrusfield 2013-10-22 Veterinary Epidemiology is an introductory text to the general concepts and fundamental principles of veterinary epidemiology. This book is composed of 20 chapters that consider the vital role of statistics in the field. The introductory chapters review the historical development of veterinary medicine, some general epidemiological concepts, and disease occurrence. The subsequent chapters deal with the transmission of infection and the ecology, patterns, and nature of veterinary diseases. These topics are followed by discussions of the importance of basic statistics and computer knowledge in the recording and analysis of epidemiological data. Other chapters consider the assays and modeling of serological epidemiology. The final chapters look into the economics and control of epidemiological diseases. This book will prove useful to veterinarians and undergraduate and graduate veterinary students.

**Udder health and communication** H. Hogeveen 2011-10-20 In dairy industries throughout the world there is a desire to optimize udder health. An improved udder health will lead to improved animal welfare, improved production efficiency and a reduction of the use of antibiotics. To improve udder health, first of all, technical knowledge on issues such as treatment, milking, infectious pressure and host resistance is important. However, over the years we learned that knowledge alone is not enough; knowledge has to be used. And for knowledge to be used, farmers have to be motivated. This requires knowledge about motivation and communication. In this book, recent knowledge on technical udder health issues is combined with knowledge on motivation and communication. A large number of descriptions of mastitis control programs that are being carried out worldwide is combined with more specific studies. These are aimed at effective advising, motivation and communication strategies, economics, and technical studies on mastitis control and prevention. Therefore, this book provides an applied source of information for all that are willing to improve udder health.

**Past and Future Vision of Veterinary Research** Kenneth Lam 2014-09-18 The Hong Kong Jockey Club (HKJC) Veterinary Departments have enabled an environment suitable to set an international benchmark on a project concept to enhance the welfare of racehorses, based on research using extensive and detailed data collection within an integrated framework. Retrospective analysis of data collected over the past several years has been made available. The approach outlined in this book has two broad objectives. The first is to investigate outcomes of interest using data which has already been collected. Outcomes of interest are likely to include (though not be limited to), variables that influence injury, retirement or performance. The second broad objective is to extend the approach to a more general assessment of the usefulness of different data types and different variables, and the assessment of data collection, collation, analysis and reporting methodology, as well as the development of intervention strategy. This book concludes with a philosophical view point on the veterinary management of thoroughbred racing injuries in which a "think-out-of-the-box" concept in assessing the risk of racehorse injuries is discussed. One outcome of this is an integrated technology approach for tracking horse performance, recently developed by Cambridge Design UK. The integrated technology (light deck recorder concept) for monitoring trackwork and race performance of racehorses can allow a standardised review of detailed training data and biometric readings from direct measurements of individual horse, to assess the progress of performance and the effect of track conditions. The development of integrated performance tracking technology is mission critical for the worldwide racing industry to optimize horse welfare, safety and racing performance, as well as to enhance the integrity of racing.

**Rabies** William H. Wunner 2010-07-26 Rabies is the most current and comprehensive account of one of the oldest diseases known that remains a significant public health threat despite the efforts of many who have endeavored to control it in wildlife and domestic animals. During the past five years since publication of the first edition there have been new developments in many areas on the rabies landscape. This edition takes on a more global perspective with many new authors offering fresh outlooks on each topic. Clinical features of rabies in humans and animals are discussed as well as basic science aspects, molecular biology, pathology, and pathogenesis of this disease. Current methods used in defining geographic origins and animal species infected in wildlife are presented, along with diagnostic methods for identifying the strain of virus based on its genomic sequence and antigenic structure. This multidisciplinary account is essential for clinicians as well as public health advisors, epidemiologists, wildlife biologists, and research scientists wanting to know more about the virus and the disease it causes. \* Offers a unique global perspective on rabies where dog rabies is responsible for killing more people than yellow fever, dengue fever, or Japanese encephalitis \* More than 7 million people are potentially exposed to the virus annually and about 50,000 people, half of them children, die of rabies each year \* New edition includes greatly expanded coverage of bat rabies which is now the most prominent source of human rabies in the New World and Western Europe, where dog rabies has been controlled \* Recent successes of controlling wildlife rabies with an emphasis on prevention is discussed \* Approximately 40% updated material incorporates recent knowledge on new approaches to therapy of human rabies as well as issues involving organ and tissue transplantation \* Includes an increase in illustrations to more accurately represent this disease's unique horror

**Ticks and Tick-borne Diseases** Mowafak Daoud Salman 2013 This book is comprised of 7 chapters covering the geographical distribution and control of ticks and tickborne diseases in the Euro-Asia region. Chapter 1 focuses on the factors behind the emergence and reemergence of tickborne diseases, highlighting the theme of environmental and climatic change and also the renewed interest in ticks and the diseases they transmit, which has been stimulated by an increased awareness of tickborne zoonoses. Chapter 2 describes the basic biology of a total of 25 important tick species endemic to part or all of the geographical region under consideration, and also includes short accounts of their life cycles, geographical distributions and significance as vectors. The factors responsible for the spread and distribution of ticks are considered in chapter 3, which include climate, land use, animal movement (both wild and domestic) and importation of exotic vertebrates. Tickborne infections are reviewed in chapter 4. The geographical distribution of tickborne pathogens is the focus of Chapter 5, in the form of maps with accompanying qualifying and illustrative comments. Chapter 6 addresses the distributions of the vector ticks. Chapter 7 addresses the surveillance and control of ticks and tickborne diseases. It includes a brief description of tick sampling methods, an introduction to the principles of surveillance and monitoring and control options for both ixodids and argasids.

The purpose of the symposium was to consider the application of science to livestock production as a complex of socioeconomic problems. It dealt not only with the impact of developments in serology and molecular biology, but also with questions of epidemiology, vaccines, information networks, geographical information systems and socioeconomic factors.

**Diseases of Coral** Cheryl M. Woodley 2016-01-26 Coral disease is quickly becoming a crisis to the health and management of the world's coral reefs. There is a great interest from many in preserving coral reefs. Unfortunately, the field of epizootiology is disorganized and lacks a standard vocabulary, methods, and diagnostic techniques, and tropical marine scientists are poorly trained in wildlife pathology, veterinary medicine, and epidemiology. Diseases of Coral will help to rectify this situation.

*Risk management strategies: monitoring and surveillance* Frans J.M. Smulders 2004-12-10 For the veterinarian, monitoring and surveillance represent the best means of ensuring sustainable animal production at a time when consumer demands reflect awareness that many of the hazards associated with food animal production can be minimised or avoided through proper management at the primary production level. Preventive medicine and quality and safety assurance programmes are primarily based on knowledge of the existing strengths and weaknesses of the clients' enterprise and their ability to enact effective intervention measures. Accordingly, the food animal veterinarian relies upon effective monitoring of current performance and herd health status both for the purpose of maximising efficiency of production and providing an assurance that the primary food product meets required health standards in terms of freedom from those agents of concern that have their origin on the farm. These agents include foodborne parasites, pathogenic bacteria, some of which display a resistance to antimicrobial agents, contaminants of environmental origin, as well as chemical and pharmaceutical residues. The more successful these hazards are addressed at the farm, the better the quality and safety of the final product and their marketing possibilities will be. Communication between the primary producer and the food processing industry that facilitates real-time exchange of information on these issues is essential for the practice of preventive medicine at the herd and flock level. Integrated food chain quality and safety control programmes, when linked to such monitoring and surveillance principles in regard to both human and animal health, represent the means of achieving sustainable food animal production on a global scale, in line with the conclusions of WTO and EU. Volume 3 of the "Food Safety Assurance and Veterinary Public Health" series addresses this collaborative approach. Leading international experts from academia, industry and governmental institutions have been identified to deal with the various aspects of this collaborative approach in monitoring and surveillance.
